A PRACTICAL PATH TOWARD $1,000/WEEK

USING CARS, CARGO VANS & BOX TRUCKS

80 PAGE FIELD GUIDE

INCOME DISCLAIMER

- This ebook is educational only. It does not guarantee income, contracts, platform approvals, or profit. No author, publisher, or distributor is liable for your business decisions or outcomes.
- Every income number in this book is a Sample Scenario — Not Guaranteed Results. These figures are based on publicly available rate ranges and typical driver expense ratios, not promises of what you will earn.
- Your actual results depend on: local market demand, vehicle type and condition, fuel prices in your area, insurance costs, hours worked, platform rules and pay changes, contract quality, and your own driving efficiency and business skills.
- Do not quit a job, sign a lease, or finance a vehicle based on sample numbers alone. Run your own 2-4 week test with tracked miles and real expenses before making financial commitments.
- For tax filing, business entity formation, commercial insurance, and DOT/licensing requirements, consult qualified professionals in your state. This book does not replace legal, tax, or insurance advice.

Rule: Gross revenue is not estimated net profit. A driver earning $1,200/week gross may net only $650-$850 after fuel, maintenance, insurance, and taxes. Always calculate net before celebrating gross.

HOW TO USE THIS BOOK

- This is a driver business field guide — not a motivation book. Read it with a calculator, a mileage tracker, and your actual expense receipts in front of you. Highlight the scripts, checklists, and formulas you can use this week.
- Every vehicle scenario in this book includes a full expense breakdown. Do not skip the math. Run the same calculations for YOUR vehicle: your fuel cost per mile, your insurance premium, your maintenance history, your local gas prices.
- Track every mile from day one. Use a free app (Stride, Everlance, or a simple spreadsheet). Log paid miles, unpaid/deadhead miles, fuel purchases, tolls, parking, supplies, and maintenance. You cannot improve what you do not measure.
- Start with one income lane — one platform, one route type, or one client. Test it for 2-4 weeks with full tracking. Calculate your true net hourly rate. Only add a second lane after the first one proves profitable.
- Use the worksheets in the back of this book every week. Enter gross revenue, subtract every expense category, and calculate net profit. After 4 weeks, you will see exactly where your money goes — and where to cut waste.

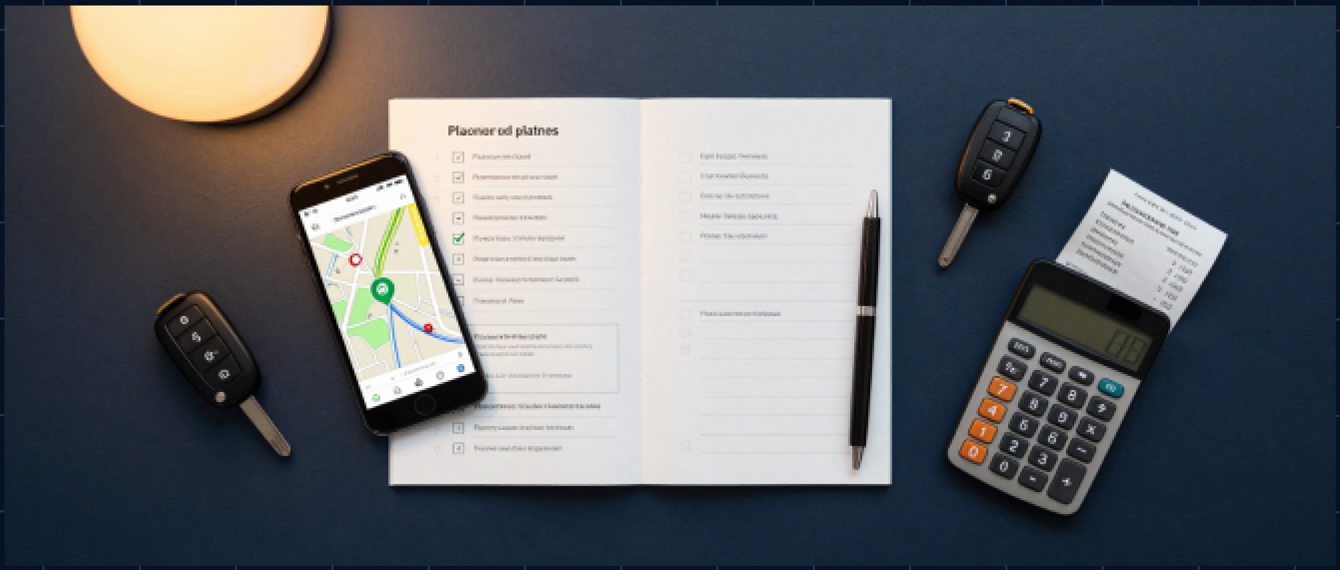
The goal is not to look busy. The goal is to keep more of what you earn.

TABLE OF CONTENTS

QUICK START ROADMAP

30-day launch path

1. Track your current vehicle expenses for 7 days
2. Pick one starting income lane that fits your vehicle
3. Test platforms, routes, or courier leads with strict mileage tracking
4. Contact 10 local businesses about delivery needs
5. Review gross, expenses, miles, and estimated net every week
6. Repeat what pays, cut what burns miles

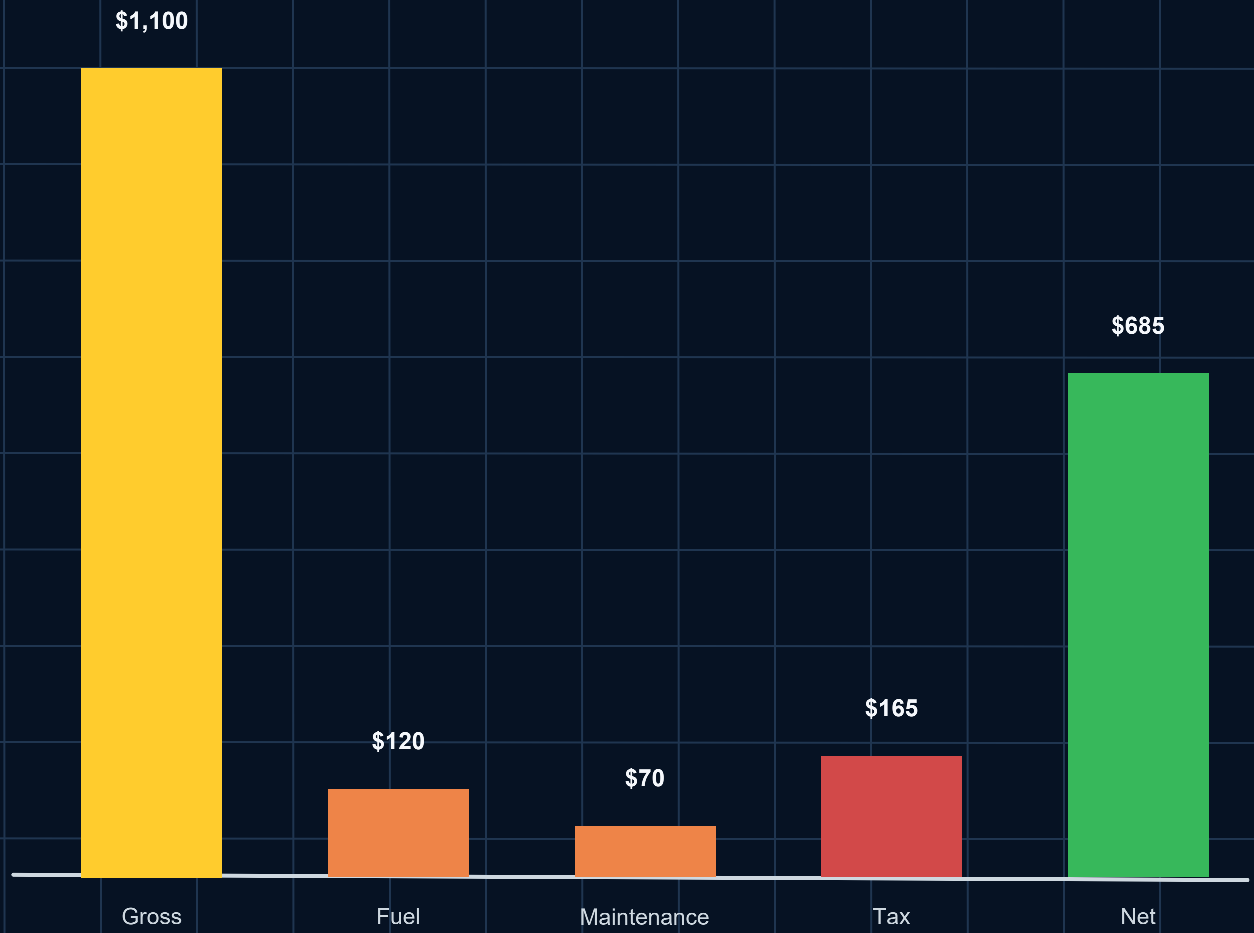


KEY DRIVER TERMS

Term	Plain Meaning
Gross revenue	Total money collected before expenses.
Net profit	Estimated money left after fuel, reserve, insurance, taxes, fees, and supplies.
Cost per mile	Weekly vehicle/business expenses divided by business miles.
Deadhead miles	Miles driven without paid cargo or paid delivery activity.
Route density	How many paid stops fit into a tight area or path.
Direct contract	A delivery relationship with a business instead of relying only on an app.
POD	Proof of delivery: photo, signature, scan, timestamp, or receipt.
COI	Certificate of insurance requested by many business clients.

GROSS VS NET PROFIT WARNING

Sample Scenario — Not Guaranteed Results



A driver can gross $1,100 and still keep far less after expenses. Track the net, not just the screenshot.

THE MATH: Gross $1,100 - Fuel $120 - Maintenance $70 - Tax Reserve $165 - Insurance $60 = **Net $685.** That is 62% take-home. Many drivers only see 50-55% after adding tolls, parking, and deadhead miles. Know your real number.

WHY VEHICLE-BASED INCOME WORKS

A practical look at demand, vehicles, and profit control

DRIVER SPOTLIGHT

Marcus T. — Houston, TX

Started with: 2016 Honda Accord, $0 savings, full-time warehouse job he hated

Marcus signed up for two delivery platforms on a Tuesday. By Friday he had made $287 working evenings after his warehouse shift (5pm-10pm, 5 nights). He was shocked — that was almost half his weekly warehouse pay for 25 hours less work.

Week 2 he added a pharmacy courier gig through a local staffing agency. They paid $18/delivery for prescription runs to elderly patients. He did 4 per day on his lunch break and Saturday mornings. That added $360/week.

By week 6, his side income ($647/week average) exceeded his warehouse paycheck ($580/week after taxes). He gave two weeks notice.

Month 3: He found a direct contract with an auto parts distributor — 12 stops/day, Monday through Friday, $175/day flat rate. Predictable income. No platform dependency. He kept one platform for evenings when he wanted extra cash.

Month 6: Grossing $1,400/week. After fuel ($140), insurance ($165/month = $38/week), maintenance reserve ($50/week), and taxes ($350/week), his estimated net profit was $822/week — 42% more than his warehouse job, with zero boss and a flexible schedule.

Results after 6 months: Sample Scenario — Not Guaranteed Results

Vehicle: Same 2016 Accord (paid off)
Weekly gross: $1,400 | Weekly net: $822
Total startup cost: $165 (first month commercial insurance)
Key move: Landing one direct contract that replaced platform dependency

DELIVERY DEMAND IS REAL

- A sedan can potentially gross $800-$1,200/week on medical courier runs, auto parts delivery, and same-day package routes in busy metros — depending on market, hours, and route density. Fuel cost: $0.15-$0.22/mile. Best for short-distance, high-frequency stops under 5 miles each.

  Medical offices, auto shops, law firms, print shops, and warehouses all need same-day local delivery. Most cannot justify a full-time driver or company vehicle for 3-8 deliveries per day.

- E-commerce grew local delivery expectations. Customers now expect 1-2 day or same-day service. Small retailers cannot match Amazon logistics alone — they outsource to independent drivers.

- Hiring a W-2 driver costs $35,000-$50,000/year in wages, payroll taxes, insurance, and vehicle costs. Contracting an independent driver for specific routes costs a fraction of that.

- This is why courier and last-mile delivery is a growing sector. The U.S. last-mile delivery market exceeds $50 billion annually. Independent drivers fill the gap between big carriers and local businesses.

- Your opportunity: solve a real logistics problem reliably. Show up on time, handle freight carefully, communicate clearly, and invoice professionally. That is what earns repeat contracts.

THE REAL OPPORTUNITY

- The opportunity is real — but only for drivers who treat this like a business. Independent delivery is not passive income. It rewards drivers who track every dollar, control expenses, build direct relationships, and say no to bad jobs. The gap between $500/week and $1,200/week is not luck — it is systems.

- They sign up for every platform without tracking results. Running 4 platforms simultaneously means no route density, more deadhead miles, and constant context-switching. One focused lane with repeat stops almost always outearns scattered multi-platform work.

- They skip insurance. Commercial auto insurance costs $150-$300/month depending on vehicle and coverage. Without it, one accident on a delivery run can end your business and leave you personally liable for $50,000+.

- They buy vehicles before securing work. A $35,000 cargo van with no contracts is a $600/month payment draining savings. Prove demand with your current vehicle first, then upgrade when revenue justifies the cost.

- They avoid direct outreach. Cold-calling 10 local businesses per week is uncomfortable but effective. One $180/day contract replaces the need to refresh a platform screen 50 times hoping for a decent route.

WHY BEGINNERS STRUGGLE

- They chase gross revenue. A driver sees $1,400/week on a platform and thinks that is income. After fuel ($280), maintenance reserve ($120), insurance ($85), and tax reserve ($210), estimated net profit is closer to $705. That is a 50% expense ratio most beginners never calculate.
- They drive too many unpaid miles. Deadhead miles (driving empty to the next pickup) cost $0.15-$0.25/mile in fuel alone. A driver doing 40 deadhead miles/day burns $6-$10 daily just repositioning — that is $150-$250/month in pure waste with zero revenue attached.
- They ignore time cost. A $25 delivery that takes 90 minutes (including drive, wait, load, deliver, return) pays $16.67/hour gross. After expenses, net drops to $8-$10/hour. Meanwhile, a $15 delivery taking 25 minutes nets $36/hour gross. Per-hour math beats per-job math every time.
- They buy too much vehicle too soon. A $45,000 box truck with a $900/month payment needs $225/week just to cover the note — before fuel, insurance, or maintenance. If you only have $1,200/week in confirmed work, that truck eats 75% of gross before you earn a dollar of profit.
- They depend on one platform. Platform algorithms change overnight. A driver earning $1,100/week on one platform can drop to $600 after a pay cut or deactivation. Smart drivers stack 2-3 income sources: one platform, one route, one direct client. Diversification protects weekly minimums.

INCOME LADDER VISUAL

Move up the ladder with discipline

1. Random Driving — $400-$800/week gross

Accept any gig on any platform. No tracking, no strategy. High deadhead miles, inconsistent pay. Most drivers stay here and burn out within 6 months.

2. Tracked Driving — $700-$1,100/week gross

Log every mile, every expense, every hour. Calculate true cost per mile and net hourly rate. Cut unpaid miles by 20-30%. This awareness alone raises net income 15-25%.

3. Route Work — $900-$1,400/week gross

Commit to scheduled routes (Amazon DSP, FedEx Ground, pharmacy circuits). Predictable daily pay ($160-$220/day), lower deadhead, and consistent weekly minimums.

4. Direct Contracts — $1,200-$2,000/week gross

Pitch local businesses directly. Offer dedicated delivery for $500-$1,000/ week per client. No app fees, no algorithm changes. You set the rate and the schedule.

5. Owner System — $2,500-$5,000+/week gross

Hire drivers, lease vehicles, manage multiple routes. You earn on every truck running. Requires $20K-$50K capital, insurance infrastructure, and dispatch systems.

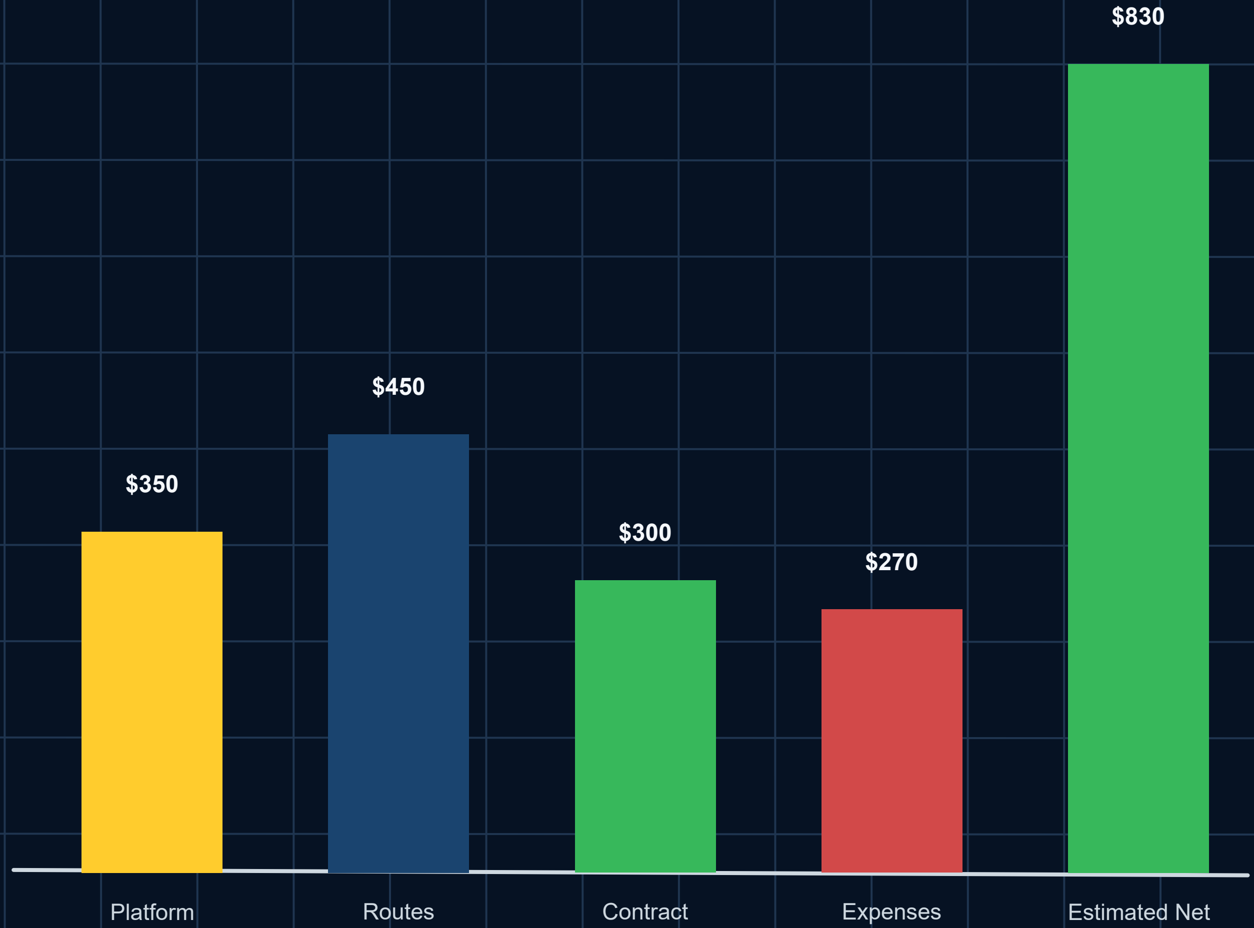
PLATFORMS VS ROUTES VS CONTRACTS

Lane	Speed	Consistency	Control	Best Use
Apps	Fast start	Low to medium	Low	Good for testing and quick cash
Routes	Scheduled repeat work	Medium	Medium	Better consistency if priced correctly
Direct contracts	Business relationship	Medium to high	High	Best path to control and repeat income
Ownership	Systems and drivers	High	Highest	Requires cash flow, training, and quality control

$1,000/WEEK TARGET EXPLAINED

Sample Scenario — Not Guaranteed Results

This sample scenario shows how a driver might combine platform work, a daily route, and one direct contract to reach $1,100/week gross. After subtracting $270 in weekly expenses (fuel, maintenance reserve, insurance allocation, tax reserve), estimated net is $830/week. Your actual results depend on market, vehicle, hours, and expense control.



Key insight: $1,000/week gross is NOT $1,000 in estimated net profit. A realistic expense ratio for independent drivers is 25-45% depending on vehicle type, fuel costs, and insurance. Always calculate estimated net profit before committing to a vehicle payment or lifestyle change.

CHAPTER 1: CHOOSING THE RIGHT VEHICLE

Bigger vehicle does not automatically mean bigger profit.

VEHICLE COMPARISON

Vehicle	Best Uses	Main Warning
Car	Food, grocery, documents, prescriptions, small packages	Limited cargo space and lower route flexibility
SUV	Groceries, retail, light courier, mixed app work	Fuel can rise while cargo space is still limited
Pickup	Local hauling, supplies, bulky items	Open bed can create weather/security issues
Cargo Van	Courier routes, medical, retail, bulk delivery	Insurance, repairs, and downtime can be expensive
Box Truck	Furniture, appliances, freight, commercial moves	Higher insurance, fuel, labor, and liability risk

START WITH WHAT YOU ALREADY OWN

- Your first goal is proving demand exists in your area — not impressing anyone with a vehicle. Run 2 weeks of tracked deliveries using your personal car. Log every mile, every dollar earned, every hour worked. If you net $15+/hour after fuel, demand is confirmed.

- A paid-off 2015 Honda Accord costs $0.12/mile in fuel and $0.05/mile in maintenance reserve. A financed 2023 cargo van costs $0.18/mile in fuel plus $450/month payment ($2.25/mile at 200 miles/day). The Accord nets more until you have $800+/week in confirmed route work requiring cargo space.

- Use weeks 1-4 to learn: Which platforms pay best in your zip code? What times have the highest demand? Which pickups are fastest and most efficient? Where are the medical offices and pharmacies that need couriers? This market research costs nothing but time — and it prevents $20K vehicle mistakes.

- Upgrade only when: (1) you have a signed contract or confirmed route requiring more capacity, (2) the new vehicle payment is under 20% of your weekly gross, and (3) you have 3 months of expenses saved. Example: $180/day route confirmed = $900/week gross. Max vehicle payment: $180/week or $780/month.

Rule: Do not buy a vehicle for a contract you do not have yet. Verbal promises are not contracts. Get it in writing with start date, pay rate, and minimum weekly volume before signing any loan.

UPGRADE DECISION CHECKLIST

Upgrade only when math supports it

1. Current vehicle is consistently booked

You are running 5+ days/week and cannot fit more stops. If your car sits idle 2-3 days, you do not need a bigger vehicle — you need more clients.

2. You are turning down profitable jobs because of size

Track every declined job for 30 days. If you are losing $300+/week in jobs your vehicle cannot handle, upgrading has a clear ROI. Less than that — stay put.

3. You have 60-90 days of expense reserve

Calculate: monthly vehicle payment + insurance + fuel + maintenance reserve. Multiply by 3. That cash must be in a separate account before you sign anything.

4. Commercial insurance quote still leaves profit

Call 3 commercial insurance brokers. Get quotes for the exact vehicle you want. Add that monthly cost to your expense sheet. If profit disappears, the vehicle is too expensive.

5. Maintenance and downtime plan is in place

Every vehicle breaks down. Budget $150-$300/month maintenance reserve for cargo vans, $300-$500 for box trucks. Have a backup plan: rental van, subcontractor, or route swap agreement.

6. New vehicle has a clear path to repeat revenue

Do not buy hoping work will come. Have at least one signed contract or confirmed route that specifically requires the larger vehicle. Speculation is not a business plan.

DRIVER SPOTLIGHT

Darnell W. — Atlanta, GA

Started with: 2019 Toyota Highlander, $1,200/week doing medical courier + evening platform deliveries

Darnell was clearing $1,200/week with his Highlander — $780 from a medical specimen route (Mon-Fri, 6am-11am) and $420/week from evening platform deliveries. Net after expenses: $840/week. Solid.

Month 4 he saw box truck drivers posting $3,000/week screenshots on YouTube. He financed a 2020 Ford F-650 box truck for $1,850/month. Insurance jumped to $540/month. Fuel went from $160/week to $380/week.

Problem: he had zero box truck contracts lined up. He assumed work would come. It did not. He spent 6 weeks on load boards competing against established carriers for $1.20/mile freight that barely covered fuel.

Month 6 reality check: Box truck was grossing $1,600/week but costing $1,380/week (payment + insurance + fuel + maintenance). Net profit: $220/week. His old Highlander setup netted $840/week.

Month 7: He sold the box truck at a $4,200 loss, went back to his Highlander, and rebuilt. Lesson learned — he had broken his own rule. He upgraded based on someone else's screenshot, not his own data.

Month 10: Back to $900/week net with the Highlander. Added a second medical route (afternoon lab pickups, $650/week). Now grossing $1,850/week, netting $1,180/week — all from an SUV he already owned.

LESSON LEARNED:
Upgrading without contracts cost him $4,200 + 3 months of lost income (~$2,520). Total damage: $6,720. He now uses the 90-day rule: track declined jobs for 90 days before any vehicle change. No data = no upgrade.

VEHICLE EXPENSE WORKSHEET

Know the cost before chasing revenue

Vehicle payment	
Insurance	
Fuel estimate per week	
Oil changes	
Tires reserve	
Brake reserve	
Repairs reserve	
Registration/tags	
Phone/platforms/tools	
Tolls/parking	
Cleaning/supplies	
Emergency reserve	
Total weekly cost	
Expected business miles	
Estimated cost per mile	

CHAPTER 1 ACTION STEPS

- List your current vehicle: year, make, model, mileage, monthly payment (if any), insurance cost, and MPG. Calculate your weekly vehicle cost. Example: 2018 Camry, paid off, $85/month insurance, 28 MPG = roughly $0.17/mile total cost.

- Identify 3 income lanes your vehicle qualifies for right now. Sedan: pharmacy courier, auto parts delivery, document runs. SUV: medical specimens, same-day packages, retail returns. Write down the top 3 and sign up for at least 2 this week.

- Call 3 insurance brokers this week. Ask for commercial auto or hired/non-owned auto quotes. Compare to your personal policy. Budget $150-$400/month depending on vehicle and coverage. Do not drive commercially on personal insurance — one claim denial can bankrupt you.

- Calculate your cost per mile: (monthly payment + insurance + fuel + maintenance reserve) divided by monthly miles driven. If your cost per mile is $0.45 and a job pays $1.20/mile, your profit margin is $0.75/mile. Never accept jobs below your cost per mile.

- Set a 90-day upgrade rule: only consider a bigger vehicle after 90 consecutive days where you turned down $300+/week in jobs due to vehicle size. Track every declined job in a spreadsheet with the pay amount and reason. No data = no upgrade.

PART 2: SET UP LIKE A BUSINESS

Random drivers get random money.
Businesses build systems.

SOLE PROPRIETOR VS LLC

- Sole proprietor: zero paperwork to start. You earn money, you report it on Schedule C. Cost: $0. Downside: your personal assets (car, savings, home equity) are exposed if someone sues you for a delivery accident. One $50K lawsuit can wipe you out.

- Single-member LLC: costs $50-$500 to file depending on your state (California is $800/year, Texas is $300 one-time). Creates a legal wall between business debts and personal assets. You still file Schedule C — taxes do not change.

- An LLC means nothing if you mix personal and business money. Courts call this piercing the corporate veil. If you pay rent from your business account or deposit business income into personal checking, the LLC protection disappears.

- Open a free business checking account (Relay, Novo, or a local credit union). All delivery income deposits here. All business expenses paid from here. Transfer yourself a fixed weekly paycheck to personal. This creates a clean paper trail for taxes and liability protection.

- Timeline: Start as sole proprietor for weeks 1-12 while proving income. Once you confirm $800+/week consistently, file your LLC and open the business account. Do not spend $500 on an LLC before you have earned $500 in delivery income. Prove the model first.

BUSINESS MONEY FLOW

Keep personal and business money separate

1. Client, platform, or route pays

Platforms pay weekly (Tuesdays typically). Amazon Flex pays 2 days after block. Direct clients: invoice net-7 or net-14. Know your cash flow timing so you never miss a bill.

2. Money lands in business account

Use Relay, Novo, or a local credit union. $0 monthly fees. All platform deposits and client payments land here. Never deposit business income into personal checking.

3. Set aside tax reserve

Move 25-30% of every deposit into a separate savings account immediately. For $1,000/week gross, that is $250-$300/week. Covers quarterly estimated taxes (Form 1040-ES due Jan, Apr, Jun, Sep).

4. Pay fuel, insurance, supplies, and maintenance reserve

Fuel: $200-$350/week for full-time drivers. Insurance: $150-$400/month commercial. Maintenance reserve: $0.10-$0.15/mile saved. Pay all from business checking only.

5. Pay yourself from what remains

After taxes and expenses are covered, transfer a fixed weekly amount to personal. Example: $1,200 gross - $300 tax - $350 expenses = $550 estimated net profit. That is your real paycheck.

6. Review weekly numbers

Every Sunday: total miles, total revenue, total expenses, net profit. Takes 10 minutes. Catches problems early. If net drops below $15/hour, something needs to change immediately.

BASIC BUSINESS SETUP

- Pick a business name that covers future growth. 'Metro Courier Solutions' or 'Apex Logistics LLC' works for package delivery today and B2B contracts later. Check your state's business name database - most are free to search online.

- Set up a free Google Voice number ($0) and a business Gmail. Never give clients your personal cell. If you stop working with a client, you keep your personal number private. Google Voice also transcribes voicemails and texts from a separate app.

- Open a business checking account the same week you start earning. Relay and Novo are free, no minimum balance. Your local credit union may offer $0 fee accounts too. Every dollar earned goes in here. Every business expense comes out of here. No exceptions.

- Use a mileage tracking app (Stride, Everlance, or Hurdlr) every single workday. The IRS standard mileage rate is $0.70/mile (2025 — check IRS.gov for current year). A driver doing 150 miles/day, 5 days/week deducts $525/week or $27,300/year. Missing even one week costs you $525 in lost deductions.

- Every Sunday night: photograph fuel receipts, log maintenance costs, and update your spreadsheet. Takes 15 minutes. Drivers who wait until April to organize receipts miss 20-40% of legitimate deductions. That is $2,000-$5,000 in extra taxes paid for no reason.

INSURANCE BASICS

- Personal auto insurance does NOT cover commercial delivery. If you crash while delivering and your insurer finds out, they will deny the claim — even if you are not at fault. One denied $30K claim means you pay out of pocket or get sued personally.

- Commercial auto insurance costs $150-$400/month for a sedan or small SUV, $250-$600/month for a cargo van. Get quotes from Progressive Commercial, State Farm Commercial, and a local broker. Compare: liability limits, deductibles, and whether gig work is explicitly covered.

- Cargo coverage protects what you are carrying — not your vehicle. Required for medical courier ($50K-$100K cargo value), auto parts ($25K+), and most direct contracts. Costs $30-$80/month. Without it, you are personally liable if goods are damaged or stolen in transit.

- General liability ($1M/$2M policy) costs $40-$100/month. Required by hospitals, warehouses, and corporate clients before they will give you a contract. Get it through NEXT Insurance, Hiscox, or your commercial auto broker as a bundle discount.

- Medical courier adds HIPAA compliance, temperature-controlled transport, and chain-of-custody documentation. Some contracts require $100K+ cargo coverage and background checks. The pay is higher ($25-$45/hour) but the insurance and compliance costs are real — budget $400-$700/month total.

Wrong insurance can wipe out years of progress. Check before you drive.

INSURANCE QUESTIONS TO ASK

Question	Why It Matters
Does my policy cover delivery/courier work?	Personal coverage may exclude business delivery.
Do I need commercial auto?	Business use changes the risk profile.
Do I need cargo coverage?	Clients may require coverage for what you carry.
Can I get a certificate of insurance?	Many business clients request proof.
Are there excluded goods?	Some freight, medical items, or valuables may not be covered.

DRIVER SPOTLIGHT

Tanya R. — Charlotte, NC

Started with: 2020 Honda CR-V, nursing assistant job ($16/hr), single mom of 2

Tanya started delivering prescriptions for a local pharmacy staffing company on her days off (3 days/week). She earned $22/delivery, averaging 6 deliveries per shift. That was $396/week for 18 hours of work — $22/hour vs. her $16/hour nursing assistant pay.

Week 4: She filed her LLC online ($125 in North Carolina). Opened a Relay business checking account the same day. Took 20 minutes total. She started depositing all delivery income there and paying herself a weekly transfer.

Month 2: She called 4 insurance brokers. Got commercial auto for $185/month and general liability ($1M/$2M) for $62/month through NEXT Insurance. Total: $247/month. She now had the paperwork to bid on bigger contracts.

Month 3: She applied to a hospital system's courier vendor list. They required: LLC documentation, commercial auto insurance, general liability COI naming them as additional insured, and a background check. Because she had everything ready, she was approved in 8 days. Most applicants take 4-6 weeks.

The hospital contract: 2 routes, Monday-Friday, 7am-11am. Picking up lab specimens from 14 clinics and delivering to the central lab. Pay: $165/route/day = $330/day = $1,650/week.

Month 6: She quit nursing. Net after all expenses (fuel $110/week, insurance $62/week, maintenance $40/week, taxes $412/week): $1,026/week estimated net profit. Working 20 hours/week instead of 40. Home by noon every day for her kids.

KEY TAKEAWAY:
Having LLC + insurance + COI ready BEFORE applying cut her approval time by 75%.
Weekly net: $1,026 working 20 hrs | Old job: $640 working 40 hrs
The paperwork investment ($125 LLC + $247/month insurance) paid for itself in 3 days.

BUSINESS SETUP ACTION STEPS

- Create one place for all business documents and receipts.
- Call your insurance provider and ask direct questions before taking paid delivery work.
- Build a simple weekly review habit: revenue, miles, expenses, estimated net.
- Use business money for business expenses and stop guessing.
- Set up to look professional before asking local businesses for contracts.

PART 3: MAKING MONEY

Use platforms and route leads to test demand. Build clients and contracts to grow.

PLATFORMS ARE A STARTING TOOL

- Delivery platforms can help you start fast, learn your market, and create quick cash flow.
- Platforms also control pricing, rules, access, and order flow, so they should not be your whole plan.
- Use platforms to learn neighborhoods, traffic patterns, peak hours, and your true cost per mile.
- Then use that knowledge to approach businesses for repeat work.

PLATFORM STACKING AND PEAK HOURS

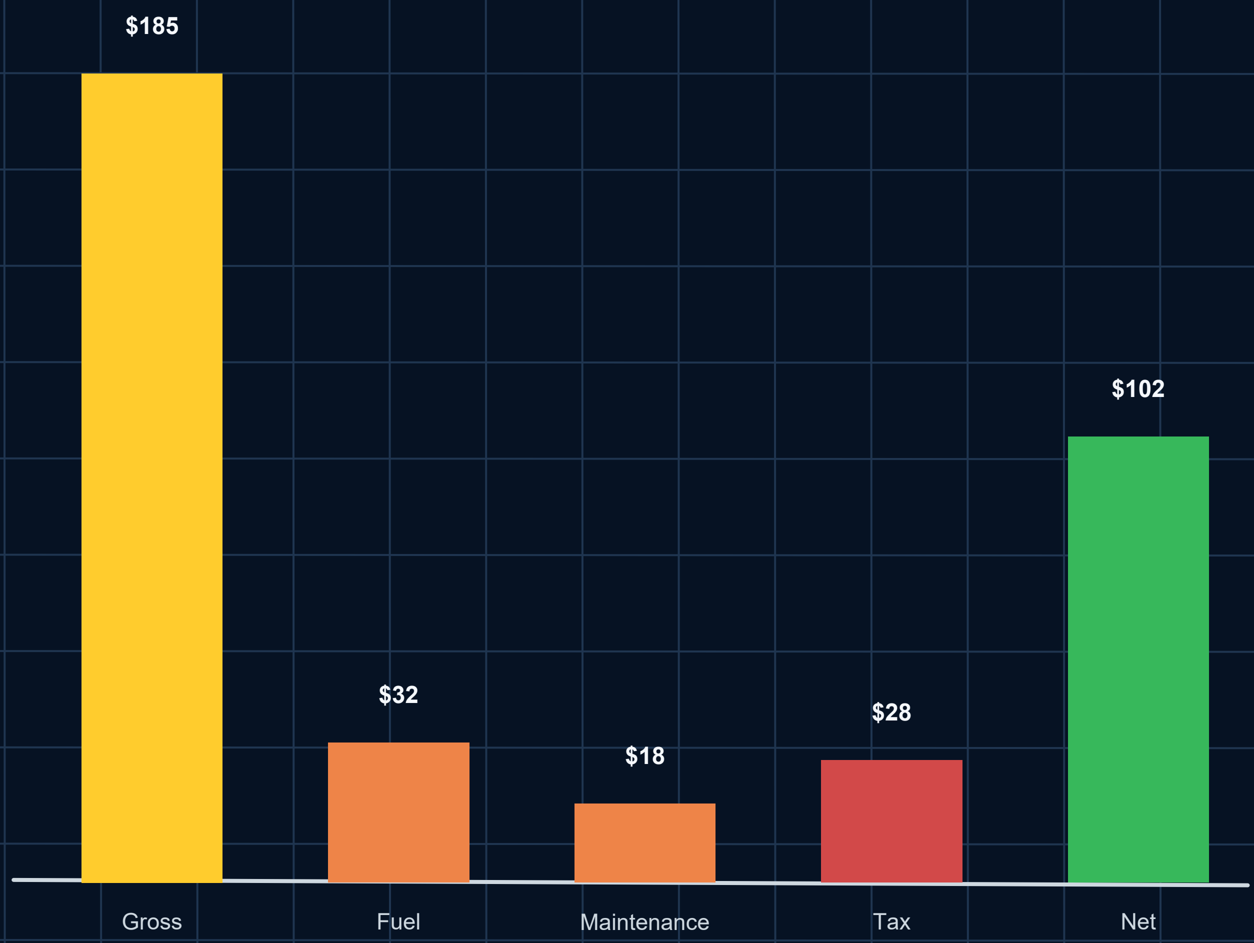
- Platform stacking means running 2-3 delivery platforms (Amazon Flex, Roadie, medical courier platforms) simultaneously so you always pick the highest-paying route. Drivers who stack platforms often see higher hourly gross — results vary by market and execution.
- Never accept overlapping orders that make you late. One late delivery can drop your rating 0.1 points — costing you priority access to high-value batches for weeks.
- Peak windows: early morning medical (6-9am), midday business rush (11am-2pm), end-of-day STAT runs (3-6pm). Weekends pay 15-30% more. Rain and snow days can double surge pricing in most markets.
- Track your own market for 2 weeks. In Houston, Sunday pharmacy runs beat Saturday retail by $8/hr. In Phoenix, Monday medical deliveries outpay Friday package routes.
- The best shift hits $25+/hr gross with under 5 miles per delivery and less than 10 minutes wait time. If any of those three slip, move to the next platform.

BAD JOB DECISION RULES

Red Flag	Why It Hurts	Better Move
Long miles for low pay	Fuel and time erase profit	Decline or wait for better
Slow restaurant/store	Unpaid wait time kills hourly profit	Avoid repeat offenders
Far drop-off outside busy area	Creates deadhead miles	Only take if pay covers return
No parking/elevator hassle	Adds unpaid time and stress	Price time into decision
Bad customer instructions	Risk of failed delivery	Communicate early

SAMPLE PLATFORM / ROUTE DAY RESULT

Sample Scenario — Not Guaranteed Results



This example shows why $185 gross is not $185 in your pocket. After fuel ($32), maintenance ($18), and self-employment tax ($28), your estimated net hourly drops from $23/hr to $12.75/hr. Track expenses every single day.

WHAT THIS MEANS: If your net hourly drops below $15 after expenses, you are subsidizing the platform with your car's depreciation. The $185 gross day above only nets $12.75/hr — below minimum wage in many states. Know your real number before celebrating gross.

PLATFORM / ROUTE TEST PLANNER

Use platforms like a data test

CHAPTER 6: MEDICAL COURIER WORK

Professionalism matters more than hype.

WHAT MEDICAL COURIERS DELIVER

- Lab specimens (blood, urine, tissue samples), prescriptions, medical devices under 50 lbs, surgical instruments, and inter-facility documents. Average pay: $18-35/delivery depending on urgency and distance.

- Time-critical runs (STAT labs) pay 2-3x standard rates but require 30-60 minute delivery windows. Temperature-controlled items need a cooler ($40-80 investment) and chain-of-custody signatures at both ends.

- Consistency beats volume. One hospital contract with 8-12 daily runs at $22 average can potentially gross $880-$1,320/week — more predictable than platform work and zero customer ratings to worry about. Results vary by market, route density, and contract terms.

- This lane rewards punctuality, a clean vehicle interior, and zero excuses. Hospitals fire couriers after 2 late deliveries. Show up 5 minutes early every single time.

COMMON MISTAKE: Accepting every STAT run without checking the return route. A $45 STAT delivery 30 miles outside your zone costs you 1 hour of deadhead driving back — dropping your effective rate to $22.50/hr before expenses.

MEDICAL COURIER REQUIREMENTS

- HIPAA awareness is non-negotiable. One casual mention of a patient name or delivery contents can result in a $50,000 fine for the facility — and immediate termination for you. Never discuss what you carry.
- Bloodborne pathogen training takes 2-4 hours online ($25-50) and is required by 80% of medical courier companies. Get certified before you apply — it separates you from 90% of applicants.
- Background checks are standard. Most facilities require a clean record for the past 7 years. A single DUI or felony disqualifies you from hospital contracts in most states.
- Vehicle cleanliness is inspected. Facilities send reps to check your cargo area before signing contracts. A $15 rubber mat, organized bins, and no personal items = you pass every time.
- Chain-of-custody documentation: timestamps, signatures, temperature logs, and photo proof at pickup and delivery. Miss one step and you lose the route. Build a checklist and use it every run.

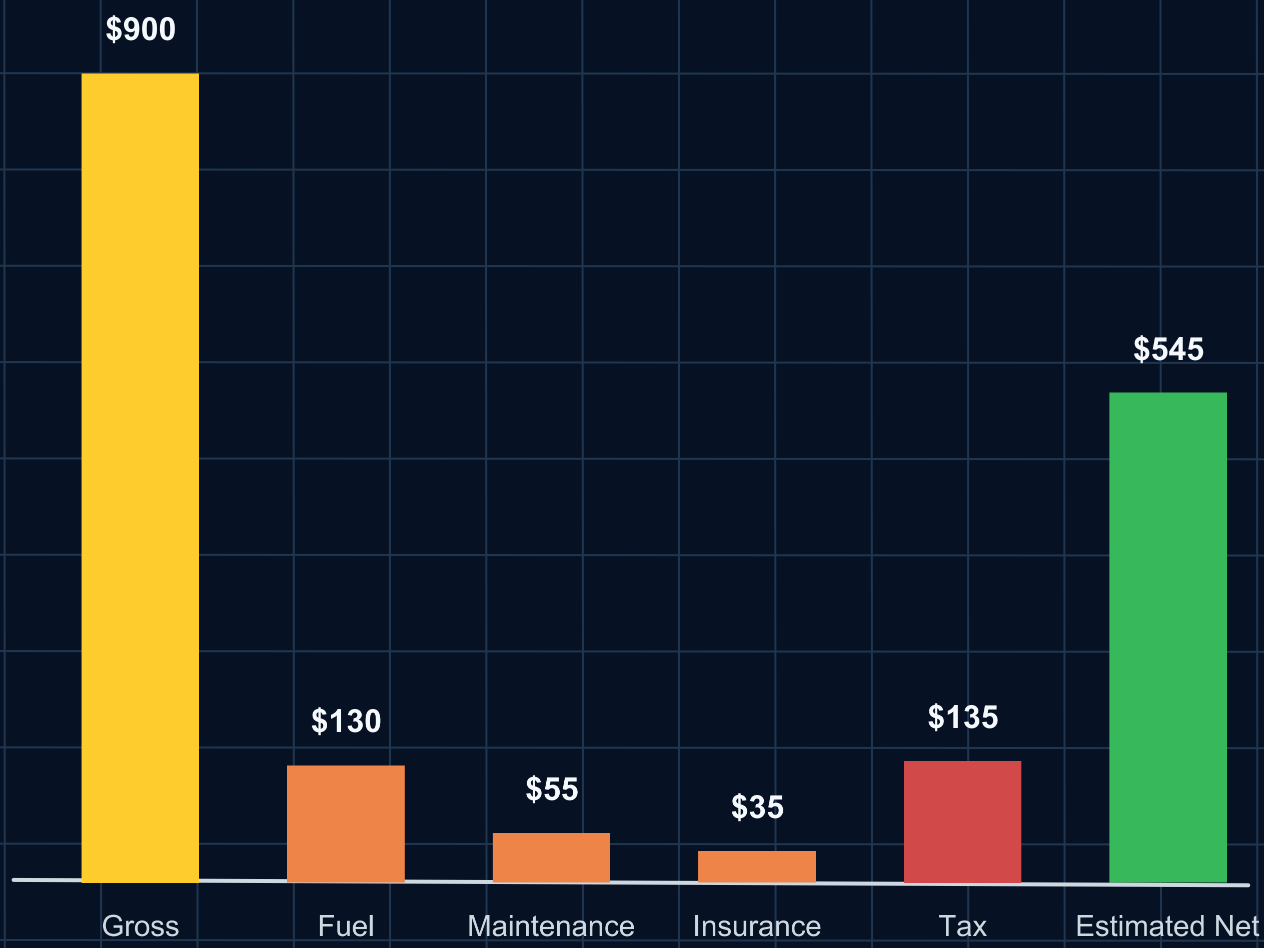
Independent courier board		Experience/vehicle type		

SAMPLE MEDICAL ROUTE WEEK

Sample Scenario — Not Guaranteed Results



This route: 5 days, 470 miles, 38 stops. Gross $900/week looks strong — but after fuel ($130), maintenance ($55), insurance ($35), and tax reserve ($135), net drops to $545. That is $109/day estimated net profit. Always run the full math before committing to a recurring route.

Route Details: 5 days | 470 miles | 38 stops | $2.37/mile gross | $1.44/mile net | Effective hourly: $13.63

If this route required a cooler, specimen bags, or chain-of-custody forms, add $15-25/week in supplies. Medical routes also require consistent on-time performance — one late delivery can cost the entire contract.

DRIVER SPOTLIGHT

James P. — Denver, CO

Started with: 2018 Chevy Equinox, delivery platforms, averaging $680/week gross

James was stuck at $680/week on platforms for 4 months. He tracked his numbers religiously: $14.20/hour after expenses. Good enough to survive, not enough to build anything.

Week 18 he tried something different. He drove to every auto parts store, veterinary clinic, and dental lab within 10 miles of his apartment. He walked in with a one-page flyer: 'Same-day local delivery, $15/stop, reliable and insured.' He hit 47 businesses in 3 days.

Results from 47 cold visits:
- 31 said 'no thanks' or 'we already have someone'
- 11 said 'leave your info'
- 4 said 'maybe, call me next week'
- 1 said 'can you start Thursday?'

That one yes was a dental lab. 8 deliveries/day to dentist offices, Monday-Friday. $120/day = $600/week. He kept one platform for afternoons.

Month 5: He called back the 4 'maybes.' Two had forgotten him. One said no. One — a veterinary supply company — said yes. 6 stops/day, $90/day = $450/week.

Month 7: One of the 'leave your info' businesses called HIM. An auto parts distributor needed a backup driver. 10 stops/day, 3 days/week. $150/day = $450/week.

Month 8 totals: Dental lab ($600) + vet supply ($450) + auto parts ($450) = $1,500/week gross from 3 direct contracts. He dropped all platforms entirely. Net after expenses: $1,080/week. Working 6am-2pm, Monday-Friday.

KEY TAKEAWAY:
47 cold visits = 3 contracts = $1,500/week. That is a 6.4% conversion rate.
He spent 3 days knocking on doors. Those 3 days replaced 4 months of platform dependency.
Cold outreach works. Most drivers never try it because rejection feels personal.

CHAPTER 7: DIRECT CONTRACTS

Contracts are built by solving business problems.

WHY DIRECT CONTRACTS MATTER

- Platforms take 15-30% of every job and can deactivate you overnight. Direct clients pay you the full rate, on your schedule, with no algorithm deciding your income.
- A single auto parts store needing 8-12 deliveries/day at $12-15/stop = $96-180/day guaranteed. That is one relationship replacing an entire day of platform-chasing.
- Your value proposition is simple: show up on time, communicate clearly, provide proof of delivery, and never damage cargo. Businesses will pay a premium for reliability over price.
- One contract leads to referrals. A dental lab refers you to a dentist. The dentist mentions you to a veterinary clinic. Within 90 days, 3 accounts can replace all platform income.
- Direct work requires follow-up. 80% of contracts are lost because the driver never called back. Set a reminder for 7 days, 14 days, and 30 days after every pitch.

COMMON MISTAKE: Pitching price instead of reliability. Businesses don't want the cheapest driver — they want the one who shows up every time without being reminded.

BEST BUSINESSES TO APPROACH

Business Type	Delivery Need	Vehicle Fit
Auto parts stores	Parts to repair shops	Car/SUV/van
Pharmacies	Prescriptions and supplies	Car/SUV/van
Labs	Specimens/docs/supplies	Car/SUV/van
Florists/bakeries	Time-sensitive local orders	Car/SUV/van
Print shops	Documents/signage/materials	SUV/van
Contractors	Small supplies/tools/materials	Pickup/van
Warehouses	Local B2B drops	Van/box truck

CLIENT OUTREACH FLOW

Turn local need into repeat work

1. Build a list of 25 local businesses

2. Call and ask who handles local deliveries

3. Visit in person with simple service pitch

4. Offer a trial delivery or backup driver option

5. Quote a clear route, stop, mile, or rush rate

6. Complete first delivery and document proof

7. Follow up and ask for repeat work

PHONE SCRIPT

- "Hi, my name is [Name]. I run a local delivery and courier service here in [City]."
- "I help businesses move parts, documents, supplies, and packages on time — without hiring another employee or waiting on national carriers."
- "Do you currently use anyone for same-day or next-day local deliveries?"
- "If your regular driver calls out, or you get a rush order that needs to go today, I can be there within an hour. I handle proof of delivery, photos, and signatures."
- "Who would be the best person to talk to about setting up a backup delivery option — or even a regular route?"

FOLLOW-UP RULES

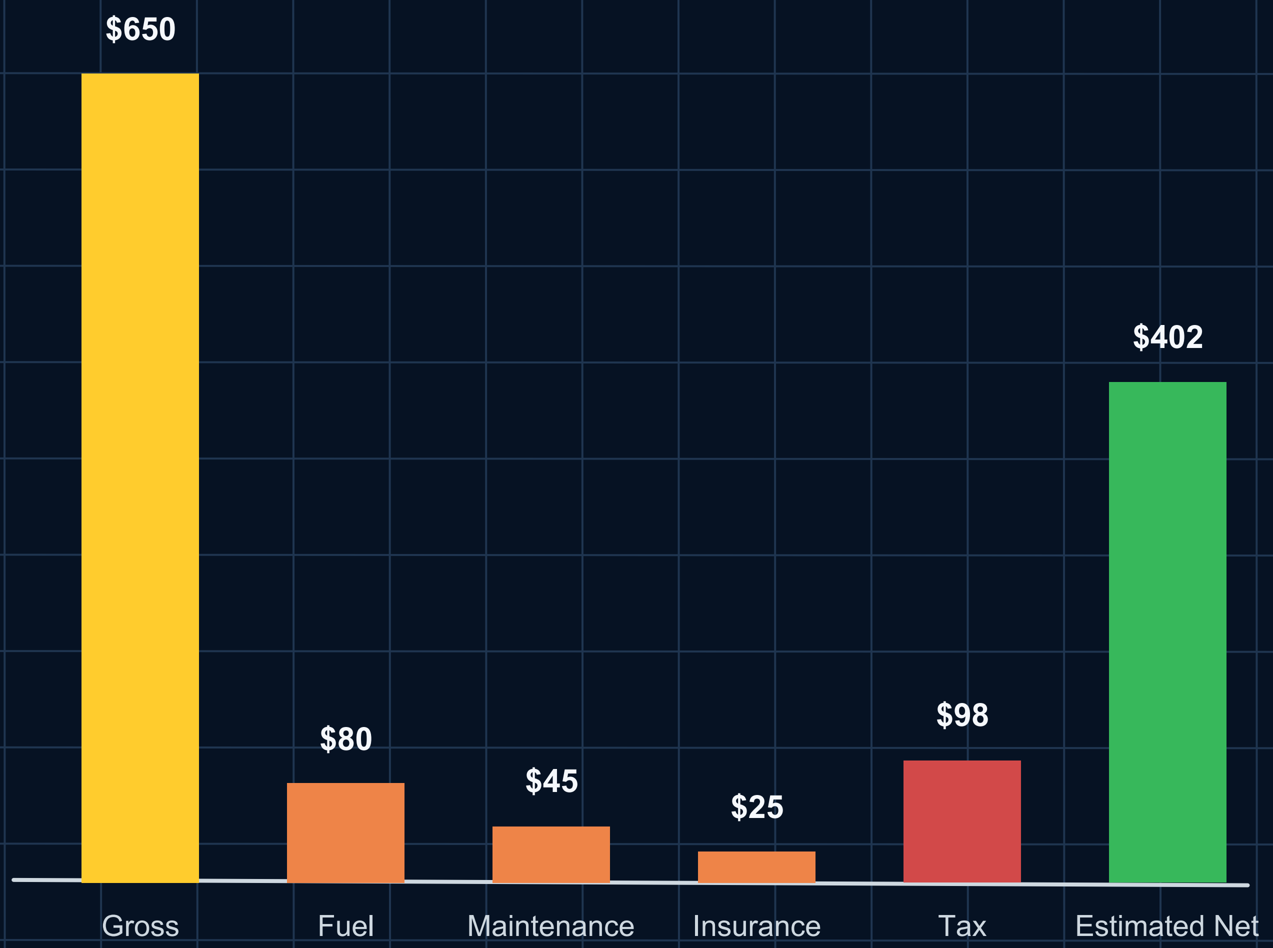
- Call back in 7 days if no response. Most businesses need 2-3 touches before they commit.
- Send a one-page rate sheet by email after the first call. Keep it simple: per-stop, per-mile, or per-route pricing.
- Visit in person on your second follow-up. Face-to-face closes 3x more contracts than phone alone.
- Track every call: date, contact name, result, next step. Use the Client Outreach Tracker on page 53.

PRICING BASICS

Pricing Method	Best For	Watch Out For
Flat route	Repeat pickups/stops	Must include mileage and wait time
Per stop	Dense local deliveries	Stops must be close enough
Per mile	Longer trips	Include minimum charge
Rush fee	Urgent deliveries	Do not underprice disruption
Wait time fee	Facilities/customers that delay	Set terms before job
After-hours fee	Nights/weekends	Charge for inconvenience

SAMPLE DIRECT CONTRACT WEEK

Sample Scenario — Not Guaranteed Results



This week: 3 direct clients (auto parts store, print shop, dental lab). 5 days, 22 stops/day avg, 310 miles total. $650 gross - $248 expenses = $402 net. That is $80.40/day estimated net profit or $16.08/hr on 5-hour routes. Direct contracts improve control, but only profitable pricing makes them worth keeping.

Route Breakdown: Auto Parts: $280/wk (12 stops/day) | Print Shop: $180/wk (5 stops/day) | Dental Lab: $190/wk (5 stops/day)

Key metric: $2.10/mile gross, $1.30/mile net. If any single client drops below $1.00/mile net after all expenses, renegotiate or replace. Track weekly — not monthly.

WARNING: This scenario assumes all 3 clients pay on time. Build a 2-week cash reserve before dropping platform work entirely.

PART 4: PROFIT CONTROL

The money is in controlling miles, time, and expenses.

REVENUE VS PROFIT

- Revenue is what comes in. Profit is what stays after fuel, maintenance, insurance, taxes, tolls, supplies, and unpaid time are subtracted. A $1,200/week gross can become $680 net — or $420 net — depending on how you run.
- Fuel is the cost drivers notice first, but it is rarely the biggest. Maintenance reserve ($0.08-0.12/mile), insurance allocation ($35-75/week), and tax reserve (15-25% of gross) add up faster than most expect.
- A 118-mile job paying $90 gross costs roughly $61 in vehicle expenses alone ($0.52/mile). Add 45 minutes of unpaid wait time and 22 deadhead miles returning home — that $90 job nets under $15.
- Drivers who track every expense weekly can spot losing routes within 7 days. Drivers who guess often run unprofitable work for months before realizing the damage.
- Your weekly review answers one question: which routes earned more than $1.00/mile net after ALL costs? Keep those. Cut or renegotiate everything else.

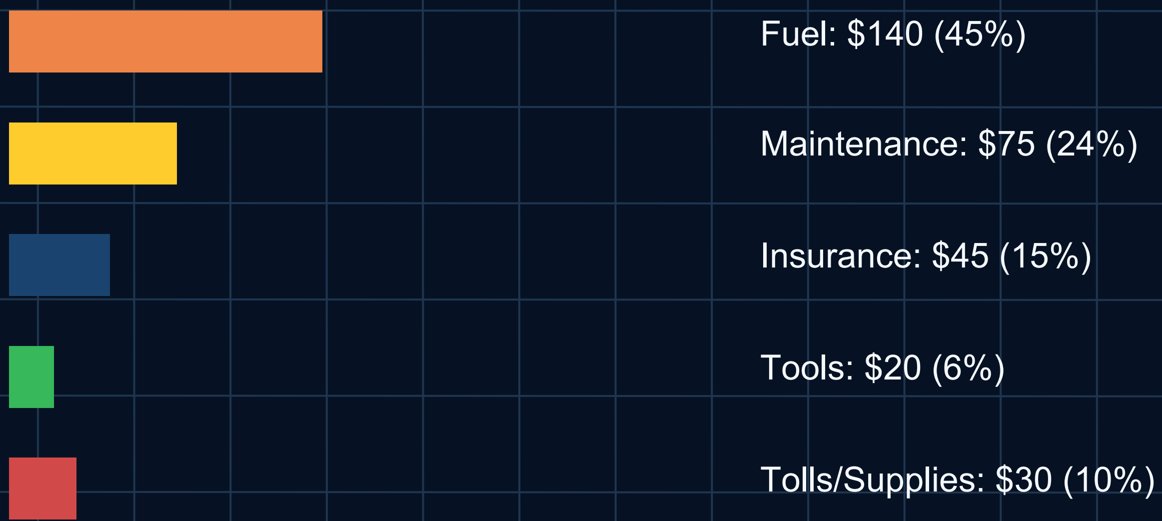
QUICK TEST: Take last week's gross. Subtract fuel, maintenance reserve ($0.10/mile), insurance ($9/day), tax reserve (20%), tolls, and supplies. Divide by hours worked. If the number is below $15/hr — that route needs to change.

EXAMPLE: Driver grosses $980/week on 540 miles. Fuel $162 + Maintenance $54 + Insurance $45 + Tax $147 + Tolls $18 + Supplies $12 = $438 expenses. Net: $542. Per mile net: $1.00. Per hour (40hrs): $13.55. Verdict: borderline — needs fewer miles or higher per-stop rate.

COST PER MILE BREAKDOWN

Sample Scenario — Not Guaranteed Results

Weekly cost components



Total weekly expenses: $310
Business miles: 600
Estimated cost per mile: $0.52

WHAT THIS MEANS: If you gross $1.80/mile but your cost is $0.52/mile, your true net is $1.28/mile. On a 600-mile week, that is $768 net before taxes. After 20% tax reserve ($154), estimated net profit is $614.

If your cost per mile rises above $0.65 (older vehicle, long deadhead, city driving), you need $2.00+/mile gross just to stay above $15/hr. Track this number weekly — it is the single best indicator of route health.

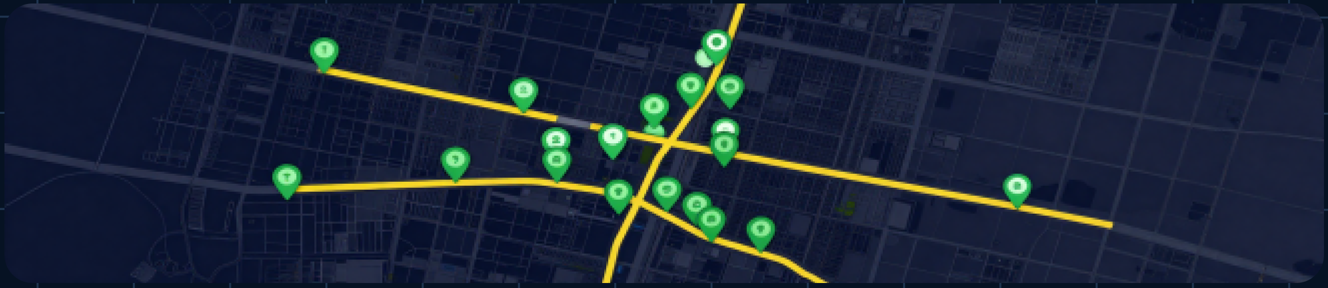
COMMON MISTAKE: Drivers who only track fuel think their cost is $0.22/mile. Real cost including maintenance, insurance, and wear is 2-3x higher.

DEADHEAD MILES AND ROUTE DENSITY

- Deadhead miles are unpaid miles driven to pickup, between jobs, repositioning, or returning home. On a 90-mile paid route with 22 miles driving to the first stop and 18 miles home after, your real mileage is 130 — but you are only paid for 90.
- Route density means more paid stops per mile driven. A 12-stop route covering 35 miles earns far more per mile than a 4-stop route covering 80 miles — even if the gross pay is similar.
- A dense $200 route (40 miles, 14 stops) nets roughly $160 after $40 in costs. A scattered $300 day (140 miles, 6 stops) nets roughly $175 after $125 in costs. The dense route pays $4.00/mile net. The scattered route pays $1.25/mile net.
- Before accepting any job, calculate total miles including deadhead. If unpaid miles exceed 25% of total miles, the route is losing density. Cluster stops geographically — never chase a single high-paying stop 30 miles outside your zone.
- Every mile should either be paid, strategic (positioning for the next paid job within 15 minutes), or avoided entirely. If a mile does not fit one of those categories, it is costing you money.

SIDE-BY-SIDE:
Dense Route: $200 gross | 40 miles | $4.00/mile net | 3.5 hrs | $45.71/hr
Scattered Route: $300 gross | 140 miles | $1.25/mile net | 7 hrs | $25.00/hr

The $200 route wins on every metric except gross. Gross is a trap.



ROUTE PLANNING DIAGRAM

Plan the route before chasing the pay

1. Start with highest priority pickup/delivery window — time-sensitive stops (labs, pharmacies, court filings) go first

2. Group stops by location and deadline — cluster within 3-5 mile radius before moving zones

3. Identify deadhead risk before accepting job — if unpaid miles exceed 25% of total, decline or renegotiate

4. Sequence stops to reduce backtracking — loop pattern outbound, never retrace unless paid

5. Confirm proof of delivery requirements — photo, signature, timestamp, or chain-of-custody form

6. Review miles and estimated net after route — log actual vs. projected to improve future decisions

PRO TIP: Plan tomorrow's route tonight. Drivers who pre-plan save 15-25 minutes of morning decision time and reduce deadhead by 10-20%. Use a simple numbered list: Stop 1 (pickup), Stop 2 (deliver), Stop 3 (pickup)... with addresses and time windows written out.

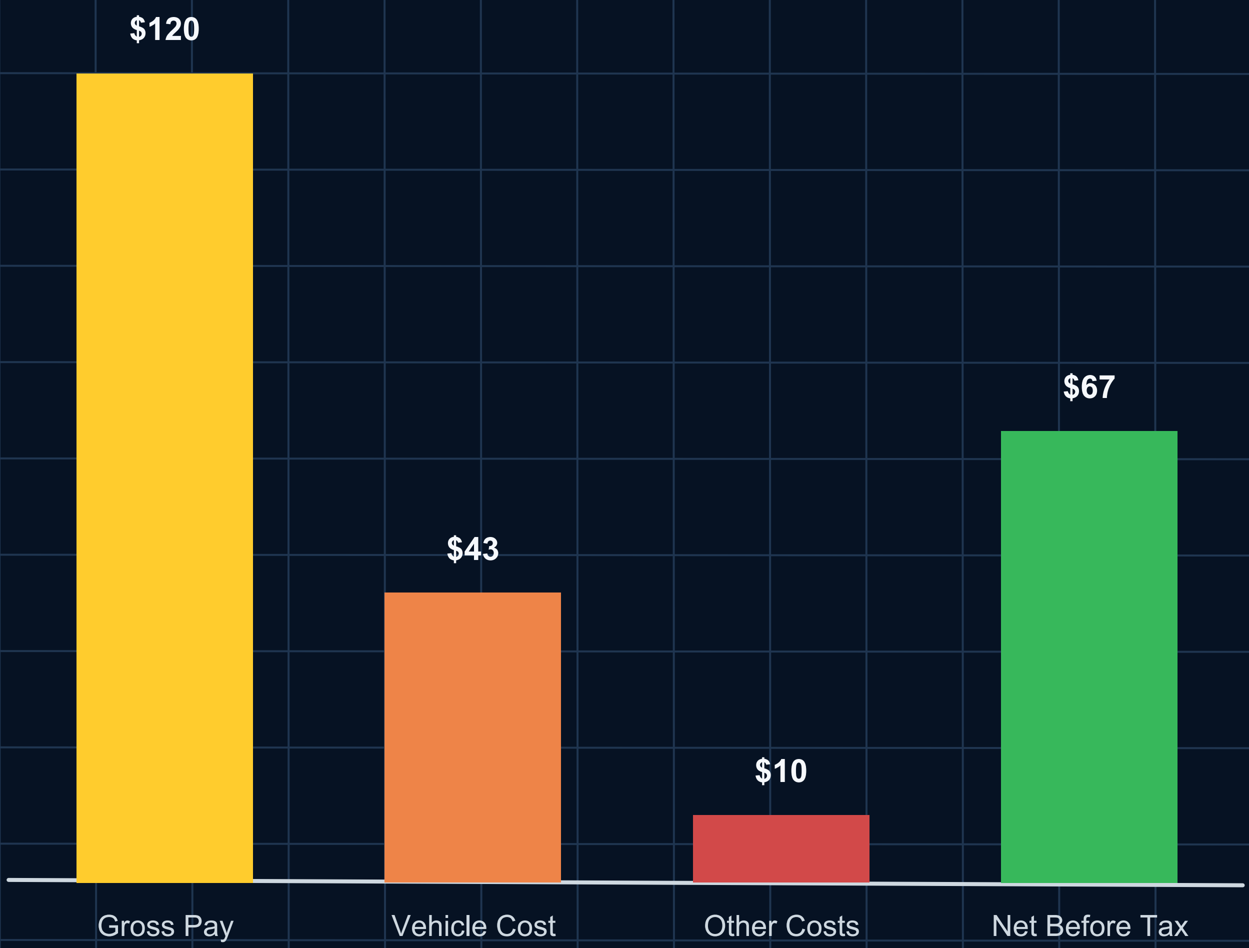
CHAPTER 9: JOB ACCEPTANCE CALCULATOR

Do not take jobs just because they pay.
Take jobs that make sense.

SAMPLE JOB DECISION

Sample Scenario — Not Guaranteed Results



Gross pay: $120. Total miles (including deadhead): 95. Vehicle cost: $0.45/mile = $43. Other costs (tolls, parking): $10. Net before tax: $67. Hourly rate at 2.5 hrs: $26.80/hr. Verdict: Only worth it if it fits your existing route or leads to repeat work. As a standalone job, the deadhead kills it.

DECISION RULE: If net per hour is below $20 AND the job does not position you for higher-paying work within 30 minutes, decline it. Your time has a floor price — protect it.

CHAPTER 10: MISTAKES THAT KILL PROFIT

Most drivers do not fail from lack of work.
They fail from bad math.

MISTAKE - CONSEQUENCE - FIX

Mistake	Consequence	Fix
Buying too much vehicle early	Payment and insurance eat profit	Prove demand first
Taking low-paying jobs	Busy days with weak net	Use job calculator
Ignoring expenses	False sense of profit	Track weekly
Wrong insurance	Claim denial or legal problems	Ask before driving
No mileage tracking	Tax/bookkeeping mess	Track every workday
No follow-up	Lost contracts	Follow up weekly

DRIVER PROFIT SELF-AUDIT

Be honest with the numbers

Do I know my cost per mile? ____________________

Did I track every business mile this week? ____________________

Did I separate business money? ____________________

Did I save receipts? ____________________

Did I reject bad jobs? ____________________

Did I contact local businesses? ____________________

Did I follow up with prospects? ____________________

Did I review net profit? ____________________

Did I schedule maintenance? ____________________

Did I improve one process this week? ____________________

- Did I research a new income lane this week? ____________________
- Did I check medical courier or B2B openings? ____________________
- Did I calculate deadhead on every accepted job? ____________________
- Did I set aside 20% tax reserve from gross? ____________________
- Did I decline at least one unprofitable job?

SCORING: 12-15 Yes = Running a real business. 8-11 Yes = Making progress, fix gaps this week. Below 8 = You are guessing, not operating. Pick 3 items and fix them before next Friday.

CHAPTER 10 ACTION STEPS

- Calculate your estimated cost per mile before taking long jobs.
- Reject work that leaves weak profit after time and mileage.
- Review the worst job of the week and decide how to avoid repeating it.
- Fix one business setup weakness: insurance, bookkeeping, tracking, or follow-up.
- Treat every mistake as a system problem that can be corrected.

WARNING: Do not sign up for every platform and think that is a business. Platforms are tools. The business is tracking numbers, controlling expenses, building repeat routes, and creating direct relationships with local companies.

EXAMPLE: A driver grosses $1,100/week but spends $180 fuel, $60 maintenance, $40 insurance, $165 tax reserve = $655 net. His cost per mile is $0.48. Any job paying under $1.50/mile after deadhead loses money. He now declines 30% of offers — and nets $720/week on fewer miles.

PART 5: WEEKLY INCOME SYSTEM

Build toward $1,000 gross, then improve take-home profit.

Sample Scenario — Not Guaranteed Results

DRIVER SPOTLIGHT

Keisha M. — Phoenix, AZ

Started with: 2017 Toyota Camry, 2 direct contracts, $1,100/week estimated net profit

Keisha had been solo for 14 months. Two contracts: a veterinary supply route ($550/week) and a dental lab route ($600/week). Net after expenses: $1,100/week. She was maxed out — no more hours in the day.

Month 15: A third contract opportunity came in — an auto parts distributor wanted 15 stops/day, 5 days/week, $200/day. She could not physically do it herself. Instead of saying no, she hired her first subcontractor.

The math: She paid the subcontractor $140/day ($700/week). The contract paid $200/day ($1,000/week). Her profit: $300/week for doing zero driving. She provided the route, the relationship, and oversight.

Month 17: She bought a used 2019 Nissan NV200 cargo van for $14,500 (financed at $380/month). Put her subcontractor in it. Added commercial insurance ($210/month for the van). The van opened bigger contracts — she landed a medical supply route paying $1,200/week.

Month 19: Hired a second subcontractor for the medical route. Paid them $160/day ($800/week). Her profit from that van: $400/week.

Month 22: Bought a second van. Same model, same financing. Moved her original dental lab route to subcontractor #3. Now she drives zero routes herself.

Month 24 numbers:
- Van 1 (auto parts + overflow): $1,400/week gross, $700 labor, $95 van costs = $605/week profit
- Van 2 (medical supply): $1,200/week gross, $800 labor, $95 van costs = $305/week profit
- Her original vet route (still drives this one): $550/week gross, $80 expenses = $470/week profit
- Total weekly net: $1,380/week. Working 4 hours/day on her own route + 1 hour dispatch/admin.

KEY TAKEAWAY:
She went from $1,100/week (maxed out, 50 hrs) to $1,380/week (25 hrs) by hiring.
Total investment: 2 vans ($760/month payments) + insurance ($420/month) = $1,180/month overhead.
Return: $3,640/month profit from subcontractors alone. 3:1 ROI on vehicle investment.

BEGINNER STAGE

- Use your current vehicle to test demand and learn your market.
- Run platforms during peak windows while tracking every mile and expense.
- Avoid unnecessary upgrades and keep startup costs low.
- Start contacting local businesses even before you feel ready.
- The beginner goal is control: know what each day actually pays after costs.

COMMON MISTAKE: Beginners spend $3,000+ on cargo van upgrades before proving demand. Test with your current car first. If you cannot net $800/week in a sedan, a van will not fix it — it will just add $400/month in payments.

INTERMEDIATE STAGE

- Add repeat route work, backup delivery work, or small local accounts.
- Track which customers, areas, and job types produce the best net profit.
- Use scripts and follow-up instead of waiting for platforms to send work.
- Start building a simple operations routine: route, deliver, document, invoice, review.
- The intermediate goal is consistency: repeatable income sources each week.

WHAT THIS MEANS: At this stage you should have 2-3 repeat customers paying you directly each week. If 100% of your income still comes from platforms, you have not graduated from beginner — you are just a faster beginner.

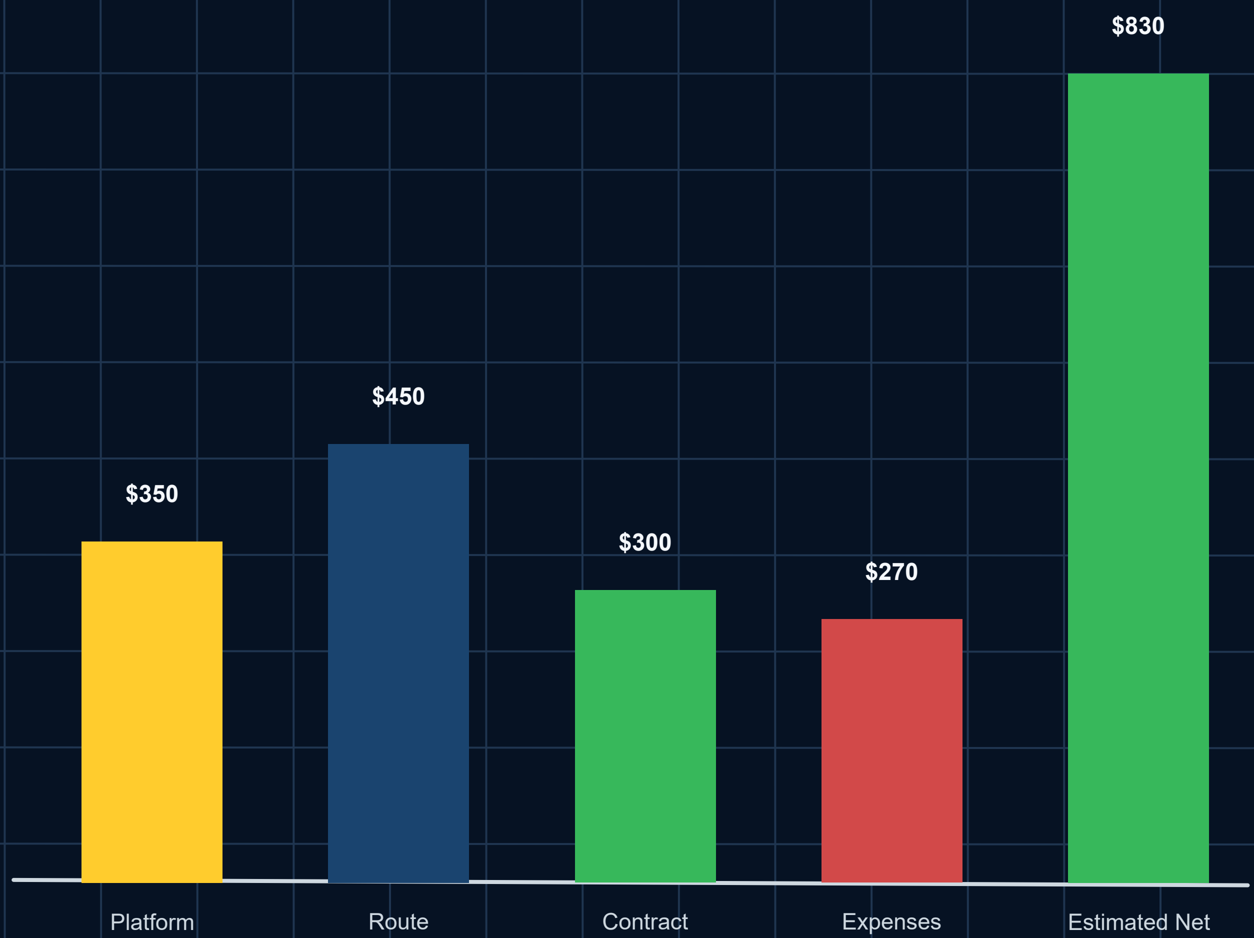
ADVANCED STAGE

- Direct contracts and repeat accounts become the main focus.
- You price jobs based on miles, time, risk, vehicle cost, and customer value.
- You document deliveries professionally and follow up like a business owner.
- You prepare systems before hiring another driver.
- The advanced goal is leverage: income that is not limited only to random platform work.

EXAMPLE: A driver with 3 direct contracts ($600, $450, $500/week) and 1 subcontractor ($300/week profit) earns $1,850/week. If one contract ends, they lose 27% — not 100%. That is the power of diversified leverage.

WEEKLY $1,000 GROSS MODEL

Sample Scenario — Not Guaranteed Results



The model is not a promise. It is a structure: quick cash + route work + direct client work.

SAMPLE WEEKLY SCHEDULE

Day	Main Work	Business Task
Monday	Route/app shift	Review weekend numbers
Tuesday	App/medical route leads	Call 5 businesses
Wednesday	Route or retail delivery	Follow up with prospects
Thursday	App peak windows	Quote one business
Friday	Route/direct client work	Invoice and collect PODs
Saturday	High-demand app windows	Vehicle cleaning/maintenance
Sunday	Light work or rest	Weekly profit review

PART 6: SCALING

Only scale what is already profitable.

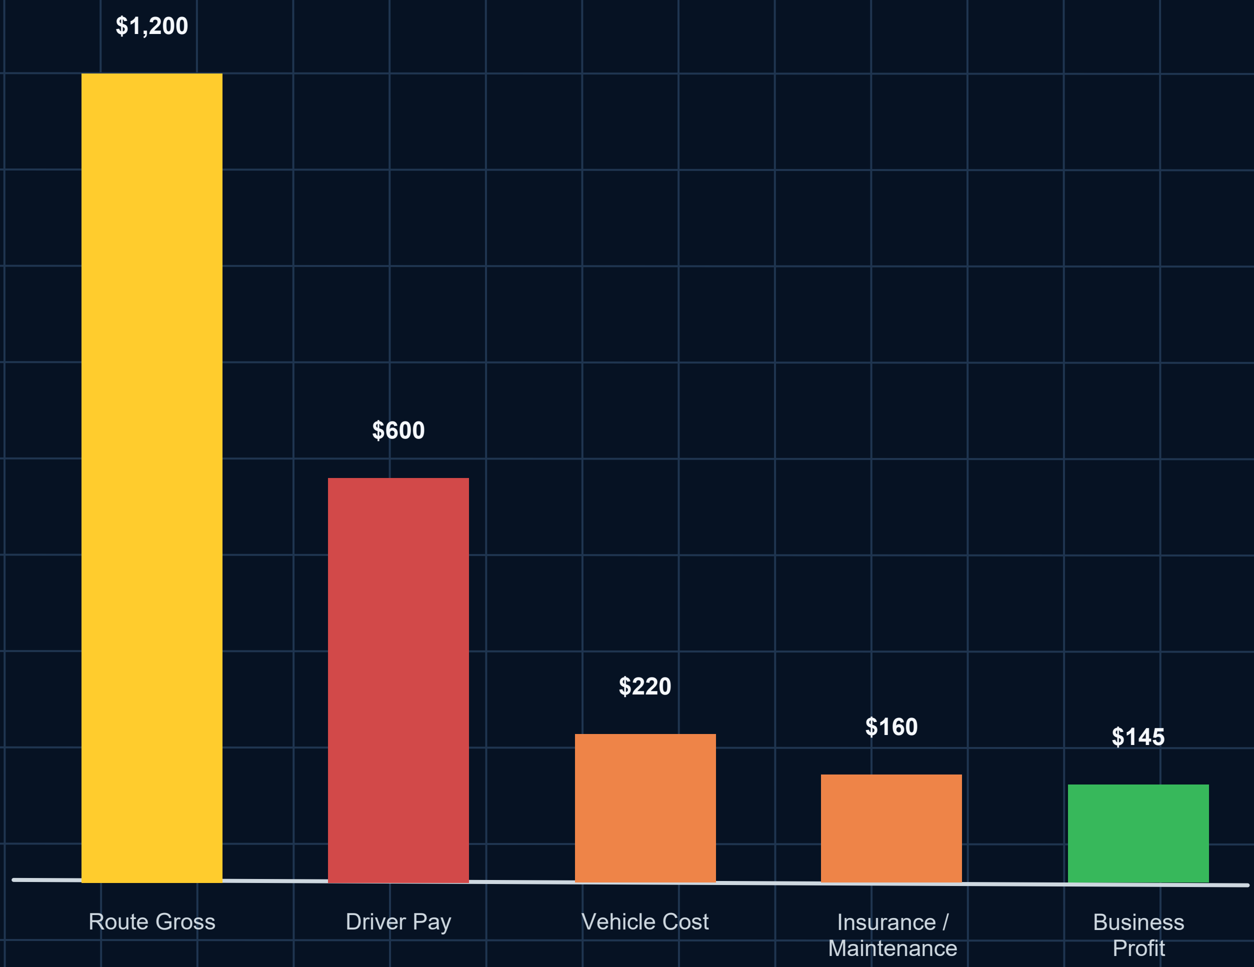
HIRING DRIVERS

- Hire only when repeat work can pay the driver and still leave business profit.
- Look for reliability, communication, clean driving record, and professional behavior.
- Train drivers on proof of delivery, customer communication, route standards, and issue reporting.
- Do not let one bad driver damage a client relationship you worked hard to win.
- Quality control matters more than adding vehicles fast.

COMMON MISTAKE: Hiring before you have enough repeat work to keep them busy 5 days/week. One slow week and your driver quits — now you have lost the training investment and possibly a client relationship.

SECOND ROUTE REALITY CHECK

Sample Scenario — Not Guaranteed Results



Scaling can look big on gross revenue but leave a small margin after driver pay and vehicle costs.

SCALE TEST CHECKLIST

Do not scale chaos

Do I have repeat work? ____________________

Can this route pay a driver? ____________________

Is insurance priced? ____________________

Is maintenance reserve funded? ____________________

Do I have backup coverage? ____________________

Do I have written procedures? ____________________

Do I have proof-of-delivery standards? ____________________

Do I have client communication rules? ____________________

Is there profit after all expenses? ____________________

Can I survive one bad week? ____________________
